Discretionary 50% take profit (Hyperliquid)

This manual uses the offline smoke, not account data or live orders. The PNG shows selected fields from actual stdout of `python scripts/smoke_take_profit.py`, which drives the CLI and the real Hyperliquid gateway over an in-memory exchange with the network forbidden.

Record one decision

Run `python -m kis_hl.cli order take-profit --id POSITION_ID --decision-id TOP_ID --rationale "Judged top"` on a `PROTECTED` Hyperliquid owner. The command only records the decision (`REQUESTED`); it never sends an order. Repeating the same decision ID is a no-op. A used decision ID, a second concurrent decision, a pending add or exit, an unprotected owner and KIS owners are rejected.

Supervisor execution and result

The running supervisor (`supervisor run --venue hyperliquid --live`) freezes 50% of the reconciled position, rounded down to the lot step, and sends reduce-only IOC sells only for the unfilled remainder. In the smoke a 10 BTC owner received a partial fill of 2, then one retry of 3, and finished `COMPLETED` with a residual of 5 still covered by the original fixed SL. A second decision halved the residual (2.5) without counting the first decision's fills. A third decision was `SUPERSEDED` when the SL filled first; no take-profit order or new protection was sent for the flat position, and the owner closed.

```
$ python scripts/smoke_take_profit.py   # selected stdout fields
{
  "take_profit_orders": [
    "side=sell size=5 reduce_only=True tif=Ioc",
    "side=sell size=3 reduce_only=True tif=Ioc",
    "side=sell size=2.5 reduce_only=True tif=Ioc"
  ],
  "first_decision": {
    "decision_id": "top-2026-10-04",
    "status": "COMPLETED",
    "basis_size": "10",
    "target_quantity": "5",
    "filled_quantity": "5",
    "residual_size": "5"
  },
  "second_decision": {
    "decision_id": "top-2",
    "status": "COMPLETED",
    "basis_size": "5",
    "target_quantity": "2.5",
    "filled_quantity": "2.5",
    "residual_size": "2.5"
  },
  "final_state": "CLOSED",
  "final_take_profit": {
    "decision_id": "top-3",
    "status": "SUPERSEDED"
  }
}
```

Check status

Run `python -m kis_hl.cli order status --id POSITION_ID` and read `take_profit`: `status` is one of `REQUESTED`, `EXECUTING`, `COMPLETED`, `BELOW_MINIMUM`, `EXHAUSTED` or `SUPERSEDED`, with `basis_size`, `target_quantity`, `filled_quantity` and `residual_size`. A reason containing "reconcile manually" means an ambiguous take-profit order outcome is never resent; protection continues and adds stay blocked. A live Hyperliquid check on 2026-10-13 (core ETH perpetual, separate test account) confirmed three things. Full-size reduce-only SL and TS orders stay open after the position halves. An oversized reduce-only trigger fills only the residual. Hyperliquid cancels the remaining protection (`reduceOnlyCanceled`) once the position is flat. HIP-3 `xyz:` markets and the tradefi subaccount were not exercised. See the full contract.
