

Protected short trailing

Operator manual | Issue 51 | Offline validation, 2026-10-03

Scope: one explicitly enrolled, already filled Hyperliquid short with verified native Stop Market protection. Managed strategy entries and adds remain long-only. No live short lifecycle was exercised.

1. Offline replay and status (S1)

Use a fresh paper database. Replay examples/trailing-stop-short-replay.jsonl, then run trailing status against that same database in a separate process. The header sets side to short. Entry 100 plus distance 4 gives initial threshold 104; completed low 92 tightens it to 96. Equality at 96 persists PAPER_EXIT and an exit intent, with zero order attempts.

```
$ python -m kis_hl.cli --db PAPER_DB trailing replay
--input examples/trailing-stop-short-replay.jsonl
{
  "state": "PAPER_EXIT",
  "side": "short"
}
$ python -m kis_hl.cli --db PAPER_DB trailing status
{
  "low": "92",
  "threshold": "96",
  "exit_intent": "trailing",
  "attempts": []
}
PASS: threshold 104 -> 96; durable intent; zero order attempts.
```

Actual CLI result, selected fields. PAPER_DB replaces the temporary path. PAPER_EXIT assumes no fill. Missing side defaults to long. The replay creates local SQLite state only.

Enrollment and recovery

2. Enroll an existing protected short (S2)

Provide --side short, the actual sell-entry order ID and buy reduce-only Stop Market ID, plus multiplier, freshness and slippage budgets. Example: trailing enroll --symbol BTC-PERP --side short --entry-order-id 123 --stop-order-id 456 --multiple 2 --max-gap-ms 15000 --slippage 0.01. Replace both IDs. Paper is the default.

```
usage: kis-hl trailing enroll [-h] --symbol SYMBOL [--side {long,short}]
                             --entry-order-id ENTRY_ORDER_ID
                             --stop-order-id STOP_ORDER_ID
                             --multiple MULTIPLE --max-gap-ms MAX_GAP_MS
                             --slippage SLIPPAGE [--live]

options:
  -h, --help            show this help message and exit
  --symbol SYMBOL
  --side {long,short}   Explicit position direction
  --entry-order-id ENTRY_ORDER_ID
  --stop-order-id STOP_ORDER_ID
  --multiple MULTIPLE   Frozen ATR multiplier
  --max-gap-ms MAX_GAP_MS
                        Explicit per-symbol freshness budget
  --slippage SLIPPAGE   Maximum exit IOC price deviation
  --live                Enroll live management state (no order at enrollment)
```

Actual implemented CLI help. Enrollment against an account was not executed. Enrollment requires terminal filled sell entry, complete directional fills, matching negative exposure/entry, eligible metadata, exact buy stop semantics and coverage. Stop trigger must be at or below entry + frozen ATR * multiplier. It creates no exchange order.

3. Recovery and limits (S3)

Covered completed nine-minute lows tighten downward. A fresh price at or above threshold requests a buy reduce-only IOC exit. Inward buy rounding and downward quantity rounding preserve the budget. Partial fills retain intent; unknown submissions are never blindly resent. Retry requires terminal evidence.

Disconnect/restart discards partial buckets and keeps the confirmed stop. Wrong-side protection, reversed/increased exposure or foreign ownership halts management. Flat cleanup cancels only the exact owned stop after reconciliation. Existing retry/deadline limits remain; MANUAL_INTERVENTION is latched.

Use the same SQLite path and account lock. Do not overlap with a managed owner. Stop management before rollback; old binaries cannot manage short snapshots. No live command is authorized by this manual. Editable source: docs/operations/short-trailing.md. Reproduce offline: python scripts/smoke_short_trailing.py.
